

Improved Wettability with Exceptional Comfort

Gas Permeable lenses have reached an exciting new level of wettability and patient comfort with our plasma treating process. Paragon Vision Sciences has combined the innovation of plasma treating lenses with Paragon HDS® Technology, the proven silicone hyperpurification process. Now, lenses manufactured with the materials from the HDS Technology family not only provide excellent oxygen transmissibility, they also deliver enhanced patient comfort in any GP lens design.

What is the Plasma Treatment Process?

Cold gas plasma is an energetic process utilizing electrical energy to transform the molecular structure of a contact lens surface. This creates desirable surface properties engineered to enhance wettability and comfort.

While studies have not been undertaken for performance properties other than wetting, products such as contact lenses and intraocular lenses have been successfully modified by plasma treatment to:

- impart protein and cell-repelling characteristics.
- decrease bacterial adhesion.
- improve wettability.
- enhance patient comfort.

Clearly, the Difference is PlasmaEYEZ

PlasmaEYEZ Treatment

Untreated Lens

When placing your next GP order with X-Cel Contacts, request a lens material from the Paragon HDS Technology family and ask for the PlasmaEYEZ treatment. Your patients will value their crisp vision, enhanced comfort and your expertise!
